

sub-0396 :: Dice WT 0.89 / TC 0.22 / ET 0.45 :: HD95 WT 6 / TC 51 / ET 48 mm :: z=73

Largest DL-vs-reference disagreement in the n=50 cohort (TC Dice 0.22, ET Dice 0.45). DL identifies a confluent necrotic core + enhancing rim (~17 cc) within the central lesion, while the UCSF-PDGM reference labels this region predominantly as edema (reference TC ~2 cc). Retained as a worst-case exemplar of cross-segmenter boundary disagreement; see Methods footnote for details.
